

Ricky (Jing Liang) Chong

Software Developer

Brisbane, QLD | 0424 755 941 | rickychongjl@gmail.com | rickychongjl.github.io/portfolio

SUMMARY

Software developer with 5+ years building and maintaining a research ethics and compliance platform used by Australian universities, working in C#, .NET Framework, SQL Server, Vue and TypeScript. Built my team's AI-assisted development workflow on Claude Code and MCP integrations, taking a task from pickup to a documented pull request. Also lead the technical side of client implementations, so I'm used to explaining SSO, identity and DNS setup to client IT teams.

TECHNICAL SKILLS

Languages: C#, TypeScript, JavaScript, SQL

Frameworks: .NET Framework, ASP.NET Core and .NET 10 (personal projects), Entity Framework, Vue 2.7, Vue 3, React (personal projects), REST APIs

Databases: SQL Server, Azure SQL

AI Dev Tools: Claude Code, Cursor, MCP integrations (Asana, Azure DevOps, Notion), parallel agents with git worktrees

Identity & Integration: SSO (OIDC, SAML2), Microsoft Entra ID, Microsoft Graph API, user and org unit sync

Infrastructure & Tools: Azure, Azure Container Apps, Bicep, Azure DevOps, GitHub Actions, Octopus Deploy, Docker, Git, Hangfire, RabbitMQ, DNS, SPF/DKIM/DMARC, Azure Communication Services

EXPERIENCE

Implementation Engineer | Endpoint IQ | Toowong, Brisbane | Jan 2021 - Present

Joined as a software developer. From my second year the role expanded to also lead the technical delivery of client implementations.

Software development

- Develop features, bug fixes and refactors across a C# .NET Framework, SQL Server and Vue 2.7 codebase.
- Introduced and enforced TypeScript in Vue components as groundwork for the move to Vue 3.
- Built data migration tooling to bring legacy client data into production during onboarding.
- Implemented SQL Server Always Encrypted to protect sensitive data at rest and in transit.
- Write SQL Server queries for data investigation and migration, including CTEs, window functions and duplicate detection.
- Diagnose production issues across SSO (OIDC, SAML2), Microsoft Graph, Hangfire jobs and RabbitMQ processing.
- Mentor junior developers in PR reviews on what a module does, how clients use it and what breaks if it changes, particularly where AI-generated code wasn't fully understood.

AI-assisted development

- Built the team's Claude Code workflow using MCP integrations with Asana, Azure DevOps and Notion: picks up a task, creates the branch, gathers context, plans and implements, opens a PR describing the change and root cause, and adds feature documentation to Notion.
- The workflow is now the base for further team automation, since extended with smoke tests, AI code review, unit and QA test generation, and PR close-out.
- Created a skill that turns a support investigation into a sprint-ready Asana task with root cause, affected release branch, reproduction steps, priority and module set, so the next developer's agent can start straight from it.
- Run multiple agents in parallel using a git worktree per release branch, each working its own Asana tasks.
- Result: more PRs shipped, more accurate tickets and fewer regressions coming out of PRs.

Client implementation

- Lead the technical side of four concurrent university implementations, covering SSO, user and org unit sync, data migration, environments, go-live and hypercare.

- Guide client IT teams through Entra app registration for SSO and user sync, DNS records for custom hostnames, and SPF, DKIM and DMARC for email sending.
- Built a reusable Notion skill that sets up a hub for each client project (SSO protocol, sync approach, tenancy, environments, migration scope), plus an integration that pulls decisions and action items from meeting notes.

PROJECTS

Budget PWA | tightarse.app | Live

- Installable budgeting app that replaced my own monthly budget spreadsheet. Tracks spending against per-category budgets in 30-day cycles, with a public demo account that resets nightly.
- ASP.NET Core (.NET 10) API with EF Core and SQL Server in a layered architecture, serving a React 19, Vite and TypeScript front end from a single container.
- Works offline: changes queue locally in IndexedDB and sync when the connection returns, using idempotency keys so nothing is counted twice. Sign-in is Microsoft Entra ID (OIDC) with a cookie session, and per-user data isolation is enforced by EF Core query filters and tested at the API.
- Runs on Azure Container Apps and Azure SQL behind Cloudflare, with infrastructure in Bicep and a GitHub Actions pipeline that deploys to Azure over OIDC. Built test first with xUnit, Testcontainers, Vitest and Playwright.

EDUCATION

Bachelor of Computer Science, University of Adelaide
